Nappy Rash

Nappy rash is skin irritation caused by urine, bowel motions or other irritants, usually around the napkin area. Good nappy changing habits can limit nappy rash, but most babies get some nappy rash no matter how well they are cared for.

Causes
A baby’s skin may be irritated or damaged by contact with:

- Bowel motions (faeces/stools/poo) – especially loose motions caused by certain foods, medicines, infections or teething
- Urine (wee) – especially when the nappy is left on too long or is covered by plastic pants. Plastic pants make nappy rash more likely by keeping the baby’s skin warm, wet and airless
- Irritant chemicals – in nappy change creams and skin wipes, or in cloth nappies which have not been rinsed completely clean. Detergents, soaps, bleach, water softeners, fabric softeners and nappy rinses can be irritants
- Friction – rough cloth nappies can damage sensitive skin.

Babies who have very sensitive skin or suffer from skin disorders (e.g., eczema/dermatitis, psoriasis) are more likely to get nappy rash.

Signs and symptoms
Simple nappy rash is a burn-like rash on the skin in the nappy area. The skin appears red, swollen, moist, and slightly rough or scaly. Skin in the creases is usually not affected.

- Nappy rash can become infected with a fungus called candida (thrush). This usually causes a brighter red, shiny rash with sharply outlined patches, often with smaller spots out of the main area. Candidal nappy rash can involve the creases, buttocks, thighs, abdomen and genitalia and may be accompanied by oral thrush.
- Nappy rash can become infected with bacteria. This may cause weeping or yellow crusting of the rash area and a fever.

Nappy rash can be painful and a baby with nappy rash can be very unsettled.

Treatment
A pharmacist can give advice about managing nappy rash and the products available to help treat and prevent it.
Simple nappy rash
Most cases of simple nappy rash resolve in 2-3 days with good skin care.

- Check nappies frequently. Change wet or dirty nappies straight away, especially cloth nappies, to reduce the time the irritated skin is in contact with urine or bowel motions. If using cloth nappies, do not use plastic overpants.
- Gently clean the baby’s bottom at each nappy change with plain warm water using a soft cloth or cotton wool. If this does not clean well enough, use a non-drying, non-soap cleanser. Avoid soap, talcum powder and ‘skin wipes’ as these may further irritate the skin.
- Pat skin dry and leave uncovered until completely dry.
- Gently clean the baby’s bottom at each nappy change with plain warm water using a soft cloth or cotton wool. If this does not clean well enough, use a non-drying, non-soap cleanser. Avoid soap, talcum powder and ‘skin wipes’ as these may further irritate the skin.
- Apply a water-repellant, soothing barrier cream or ointment, after cleaning the baby’s bottom, at each nappy change. This provides a water-resistant protective layer and helps soothe the baby’s skin.
- Leave the nappy off as much as possible to expose the skin to the air. Take care if the baby is outdoors, as a baby’s skin is sensitive and burns very easily.
- While the baby has nappy rash use disposable nappies if possible, as they keep the skin drier, especially overnight. Choose the most absorbent type.
- Non-soap bath solutions and oils can be added to the baby’s bath to help settle skin irritation (e.g., oiled oatmeal or a handful of oats in the foot of an old stocking).
- Give paracetamol for pain relief if the baby is unsettled.

More severe nappy rash
- Hydrocortisone cream or ointment, which reduces inflammation, may be used for a short time to treat a severe rash.
- If the rash is infected with a fungus (e.g., thrush) an antifungal cream or ointment may be needed.
- Consult a doctor if nappy rash does not clear with hydrocortisone and antifungal treatment, or if bacterial infection is suspected.

Prevention
- Check nappies frequently. Change wet or dirty nappies straight away.
- Gently clean the baby’s bottom at each nappy change with plain warm water using a soft cloth or cotton wool. Use a non-drying, non-soap cleanser when necessary. If using skin wipes, only use non-alcohol wipes that are made for babies.
- Pat skin dry and leave uncovered until completely dry.
- Apply a protective barrier cream or ointment at each nappy change.
- Expose skin in the nappy area to air as much as possible by giving the baby frequent nappy free times.
- If possible, use highly absorbent disposable nappies, especially at night.

If using cloth nappies:
- Rinse wet or dirty nappies before placing in nappy soaking solution. Use gloves or wash hands well after handling dirty nappies.
- Wash nappies with pure soap or detergent for sensitive skin.
- Rinse nappies well after washing, to remove soaps and other chemicals.
- Use a one-way nappy liner next to the baby’s skin and avoid plastic overpants.
